

Trust Teaming - Project 6

By Michal Bodzianowski

Status Summary

Base framework done- website and data models implemented and completed. Business logic/login/admin yet to be done, as well as experiment logic. Basic login page created but not yet hooked up to anything on the backend. Got 3rd party libraries integrated and working for now. So far the implementation has been faithful to the original design, but has been simplified slightly on the data management side due to the powerful capabilities of the Python-Redis ORM library I am using.

Class Diagram

Plan for Next Iteration

The plan is to continue on the current route, and add the authentication system now that the database section has been implemented. I plan to add more cores, and try to get them integrated with the rest of the system. Hopefully I am able to complete everything in the original plan, and that it keeps going smoothly as the initial development has.

Demonstration

Login

Code

User ID

Submit

This is all I have in terms of UI at this point. The rest is in the code!
